

<C>: Break-continue statement:

Statements in this category:

- i) break
- ii) continue
- iii) go-to.

i) break:

It is used to exit the loop completely if break is encountered.

(*) Syntax:

break;

For certain conditions, we can use while loop inside instead of break inside for loop if possible.

ii) continue:

It is used to exit a step of loop but not the loop completed when continue is encountered.

(*) Syntax:

continue;

(ii) go-to :

It is used to transfer control of program away from its normal execution path. It has two types:

(i): forward jump

goto label;

label: statement ←

Here middle part is skipped.

(ii) backward jump

label: statement ←

goto label;

Here middle part gets repeated once.
